

# Sayers Breach & Attack Simulation

## The Ultimate Hacker Test

Sayers, partnered with SafeBreach, is offering a free breach and attack assessment to put your security tools to the test.

Our “safe” assessment will run through the largest hacker’s playbook, validate security across the full kill chain and provide actionable results with no impact to your production environment.

## Prioritize Investment Based on Actual Risk:

Challenges	How it Will Be Addressed
Protecting Sensitive Data	Ensure threat inspection policies are actually working against high-profile attacks, and then visualize the impact of attacks via a cyber kill chain view
Security Exposure	Ensure your organization hasn't inadvertently left any exposing vulnerabilities
Business Rationalization	Build the business case to enable additional features when security gaps are discovered
Security Controls: Validation & Optimization	Challenge and optimize security policies for the best defenses
Compliance	Validate segmentation for PCI, GDPR, HIPAA, and other regulatory requirements
Encrypted Traffic	Show where encrypted traffic can be used to bypass security, and tunnel data out to command and control
