SSL Visibility POC

How we can help:

Encrypted traffic has long been a blind spot in all security tools. Gaining visibility and control to inspect encrypted traffic quickly can be complex, and there are many competitors in the market. Product technology must work with existing tools, be reliable and scalable. Sayers was asked to provide visibility into encrypted traffic quickly and its customer did not have the resources to evaluate the options on their own. Using our knowledge of the SSL Visibility market, we met with the customer and explained the top options in this space. Using the objective information we provided, the customer determined their top contenders and asked Sayers to build a lab to test the solutions with their multiple network security tools. With Sayers, the customer, and vendor technical resources present, a test scenario was run and within 2 days, testing was completed and solution proven to the customer.

What you will receive:

- Assessment and recommendation

- Fully architected lab to test products that work best in your environment in less than 5 days

- Gain visibility and control over encrypted traffic quickly

- No disruption to production environment

- Get more intelligence out of your existing network security tools

Risk introduced by SSL Traffic.
