SSL Visibility POC

How we can help:

Encrypted traffic has long been a blind spot in all security tools. Gaining visibility and control to inspect encrypted traffic quickly can be complex, and there are many competitors in the market. Product technology must work with existing tools, be reliable and scalable.

Sayers provides swift visibility into encrypted traffic quickly with zero impact to the production network. Using our knowledge of the SSL Visibility market, we can create a test lab where the latest and greatest SSL visibility technologies are evaluated. Sayers generates network traffic, then decrypts this traffic using multiple scenarios and multiple network security devices.

With Sayers, the customer, and vendor technical resources present, a test scenario can run, provide a proven solution without disruptions to the production environment.

What you will receive:

- Assessment and recommendation
- Fully architected lab to test products that work best in your environment in less than 5 days
- Gain visibility and control over encrypted traffic quickly
- No disruption to production environment
- Get more intelligence out of your existing network security tools

Risk introduced by SSL Traffic.
